

Summit Lake of 350 acres lies on Prince of Wales Island between the head of the West Arm of Cholmondeley Sound and Copper Harbor on Hetta Inlet at an elevation of 1298 ft. There are falls impassable to fish between the lake and those below and Copper Harbor. The shorelines are mostly quite steep and bedrock and the area surrounding is alpine and subalpine. The main inlet is from Lake Marge which lies above and is impassably steep. The water carries muskeg stain and the drainage to the lake is 2030 acres. Water depth is estimated to be over 200 ft. Grayling eggs were planted in the main inlet in 1962. It was gill netted for 6 net days on July 29. Five grayling were in the nets and these were 12.25 to 13 inches long. These fish were quite heavy for their length averaging almost 1 pound each. The scales are beyond the ability of this agent to read.
